

Box Construction

The cabinet box construction is a critical aspect to consider when choosing cabinets for your home. The two primary materials used for cabinet box construction are plywood (Classic) and particleboard (Pro). High-quality construction is essential to ensure the integrity of the cabinets. Cabinet boxes are constructed using strong joinery to ensure that they can withstand the weight of the contents inside. Quality hardware, such as hinges and drawer slides, are used for functionality of cabinet doors and drawers. Integrity Cabinets want to ensure that your cabinets remain functional and beautiful for years to come.
